README

Model Context Protocol (MCP) for NASA Earthdata Search (CMR)

This module is a [model context protocol](#) (MCP) for NASA's earthdata common metedata repository (CMR). The goal of this MCP server is to integrate AI retrievals with NASA Catalog of datasets by way of Earthaccess.

Dependencies

uv - a rust based python package manager a LLM client, such as Claude desktop or chatGPT desktop (for consuming the MCP)

Install and Run

Clone the repository to your local environment, or where your LLM client is running.

```
git clone https://github.com/podaac/cmr-mcp.git
cd cmr-mcp
```

Install uv

```
curl -LsSf https://astral.sh/uv/install.sh | sh
```

```
uv venv
source .venv/bin/activate
```

Install packages with uv

```
uv sync
```

use the outputs of `which uv` (UV_LIB) and `PWD` (CMR_MCP_INSTALL) to update the following configuration.

Adding to AI Framework

In this example we'll use Claude desktop.

Update the `claude_desktop_config.json` file (sometimes this must be created). On a mac, this is often found in `~/Library/Application\ Support/Claude/claude_desktop_config.json`

Add the following configuration, filling in the values of UV_LIB and CMR_MCP_INSTALL - don't use environment variables here.

```
{
  "mcpServers": {
    "cmr": {
      "command": "$UV_LIB$",
      "args": [
        "--directory",
        "$CMR_MCP_INSTALL$",
        "run",
        "cmr-search.py"
      ]
    }
  }
}
```

```
}  
}
```

Use the MCP Server

Simply prompt your agent to `search cmr for...` data. Below is a simple example of this in action.

Search CMR for datasets with keyword Climate

I'll search for NASA datasets related to climate in the Common Metadata Repository (CMR). Let me do that for you now.
